

Qualtrics Instructions

On the home page click +CREATE SURVEY

Select "Survey"

Give your survey a unique title so your group knows which survey is yours.

(Anytime you need to return to your survey, go to the "My Surveys" tab and click "edit" to the right of your survey's name.)

ADD BLOCK (bottom right corner) to add the next section of your survey. Make sure you include an introduction or transition to let participants know what they're getting into. If you have a mix of general and specific items, go from general to specific. If all of your items within a scale are of the same level of specificity, then randomize the order of the questions within the page (you do not have to do this manually; see next paragraph).

CREATE A NEW ITEM:

This button allows you to add a question and select which type of question format it should take (I outline all of the different question formats you may want to use in your survey below). By default it adds a multiple choice question, but you can change that using the green box on the right. Feel free to explore other formats than just those listed below.

Blue plus adds items above/below; red minus deletes items.

For all items, you can force participants to respond. Whether you should do this depends on your survey.

On the right side of the screen, you will see three dots that will lead to menu options to copy, move, and preview questions. Copying is useful for saving time if you have similar response scales for multiple items.

You can also drag each question box up or down to change question order. Note that you can move items and copy/paste items between blocks as well.

DIFFERENT QUESTION FORMATS:

- *Multiple choice questions:* Enter the prompt in the top box and enter the response options for each radio button separately. On the left edit menu, you can specify whether you will allow multiple responses or just one, how many response options there are, whether you want to randomize responses within the *question*, and others. Note that you can also display options horizontally or in columns as well.
- *Text Entry:* when you want to give participants an open-ended response option. Note that you have textbox size options on the left of the screen (participants will use the size of the box as a clue to how much you want them to write).
- *Text/Graphic:* This format allows you to enter text on the page without any response options and/or allows you to insert an image into the survey.
- *Matrix table questions:* This may be a more efficient way to organize your items if they all have the same response scale. On the left side of screen you can adjust how many statements and radio buttons you want. Simply click on the text boxes to fill them. Enter a

space in those boxes that you want to remain blank. You also have the option to specify single or multiple answers (you will most likely only want single answers).

- *Slider*: Can use bars, sliders, or stars; see left side of the screen. Gives you a more sensitive measure (due to the potentially greater variance in responses on 100 as opposed to 7 point scales). See other sliding scales under specialty questions.
- *Page breaks*: these appear on the right drop down menu for each question and can be very useful to help keep your survey from getting to busy.

BLOCK OPTIONS

You can tell qualtrics what you want to call each block by double clicking the title. You can also tell qualtrics to randomize questions within a block under the “BLOCK OPTIONS” menu.

OTHER SETTINGS

SURVEY FLOW (left image button)

Qualtrics can randomize pages within the survey (i.e., allows you to counterbalance the order in which participants complete different portions of the survey or assign people to different groups). Be careful to make sure you don’t randomize all pages (e.g., maybe you always want the demographics page to be the last page). Click “add new element”, organize your blocks appropriately (use “MOVE” in the bottom right of each block), and then if necessary adjust “randomly present X elements.” MAKE SURE TO SAVE CHANGES.

LOOK & FEEL (left image button)

You can change the style of the survey if you are so inclined. I would recommend leaving the next/back buttons and progress bar as they are.

SURVEY OPTIONS (left image button)

I would leave everything as is.

SPELL CHECK, PRINT SURVEY

These tools appear at the top, under the Tools dropdown menu. Spell check and accessibility checking are within the Review section and Print survey is within the Import/Export section. Use them!

Getting ready to launch

PREVIEW SURVEY

Once you are done adding your items, click on the preview survey icon at the top of the screen. This will take you through to make sure your survey looks exactly how you expect it to look (e.g., check to make sure your items are being randomized).

PUBLISH YOUR SURVEY

Once you are certain that your survey is perfect, click the “Publish” button on the top right to make it open to send out. Your link will pop up, or you can find it in the “Distributions” tab. TEST IT.

TRY IT OUT: if you can do all of these things in Qualtrics, you can do pretty much anything.

- Make a new block.
- Put a page break between two blocks.
- Create a text-entry box where participants have to enter a value between 1 and 100.
- Create a multiple choice question with an “Other” option where participants can fill in a blank.
- Create a matrix table where the individual items are randomized within the block.
- Create two blocks of questions and counterbalance them.
- Use the survey flow to randomly assign participants to see one set of blocks, or another set.
- Find the option that prevents participants from taking the survey multiple times.
- Use survey logic to kick participants out if they choose the wrong option (for example, they don’t consent to the consent form).
- Change the end-of-survey message to a custom message.
- Use display logic to display a question only if participants have chosen a particular option earlier in the survey.
- Remove the progress bar.
- Create a slider that starts at a custom position.
- Preview your survey to make sure all of these things work.
- BONUS: Use custom validation to force participants to write 100 words in a text entry box before they can advance the survey (use Google!).
- BONUS: Use piped text to show participants something that they typed earlier.

For more help look at Qualtrics own help page. It’s quite well written!
